PROFESSIONAL SUMMARY

- Data Engineer specializing in data standardization, identity resolution, and enterprise-scale analytics platforms; design and deliver scalable Snowflake/dbt solutions that transform complex, multi-source data into trusted, analytics-ready outputs through deterministic business logic and rigorous data-quality controls.
- Contributor across 1,400+ production data models in a multi-client (multi-tenant) cloud platform, owning work end-to-end from design and architecture through testing and post-deployment validation.
- Specialize in identity crosswalks, person-matching, and reusable common-format architectures, with a strong data-quality-control mindset and meticulous, well-documented work.

CORE TECHNICAL SKILLS

- **Data Platforms:** Snowflake, dbt, SQL, Python, AWS (S3, Step Functions).
- **Data Engineering:** Data Modeling, ELT, Data Warehousing, Analytics Engineering, Identity Resolution, Data Quality, Data Governance.
- **Engineering Practices:** Git/GitLab, CI/CD, Technical Documentation, Architecture Design, Data Lineage.
- **AI-Augmented Engineering:** Cursor and ChatGPT for SQL development, documentation, testing, and analysis, with all outputs validated against requirements, codebase standards, and production behavior.

PROFESSIONAL EXPERIENCE

Data Engineer - EAB

November 15, 2021 - June 30, 2026

- Designed and maintained enterprise-scale Snowflake/dbt pipelines across a platform of 1,400+ production data models, owning components end-to-end from ingestion through standardization, analytics, and export delivery.
- Established reusable transformation patterns and layered modeling conventions adopted across the platform, improving maintainability and accelerating onboarding of new data sources.
- Designed and implemented reusable standardization frameworks that transformed high-volume, multi-source data into a common format, enabling consistent analytics and reducing downstream complexity.
- Architected identity-resolution and person-matching frameworks that improved record-linkage accuracy and deduplication across multiple source systems.
- Established data-quality and validation strategy (grain/uniqueness, null, and row-count reconciliation) with phased post-deployment validation to guarantee trusted outputs.
- Designed feed-monitoring and alerting logic that surfaced delivery failures earlier and improved operational visibility across scheduled data pipelines.

- Authored technical documentation, tests, and onboarding material that codified standards and supported platform migration efforts.
- Automated scheduled deployment of dashboards and client-facing reports.

Personnel Chief - United States Marine Corps

September 1998 - February 2016

- Personnel administration, records, and compliance; trained and supervised personnel for readiness and reporting.
- Automated the distribution and analysis of mandatory-training compliance data (20+ modules) for **1,200+ personnel across 20+ Department of Defense organizations**, including Joint Staff, DTRA, DARPA, DIA, NDU, and WHMO; built MS Excel solutions with complex formulas that broke a single enterprise master report into 20+ targeted, section-level reports flagging complete vs. incomplete training with names and dates - an early analog to the data standardization and pipeline work I do today.
- Recognized an operational bottleneck and engineered a data-driven fix: replaced manual sign-in with an MS Excel check-in system keyed on DoD ID lookup, cutting per-person processing from 30-60 seconds to under 5 (up to 12x faster) and clearing long lines of senior officers - the same instinct for turning slow, manual processes into automated, data-backed workflows that drives my engineering work today.

EDUCATION

- **B.S., Computational and Data Science** - George Mason University, 2017-2021.
- **Northern Virginia Community College** - 2016-2017.
