PROFESSIONAL SUMMARY

- Data Engineer building enterprise-scale pipelines that turn messy, multi-source data into clean, reliable, analytics-ready outputs.
- Contributor across 1,400+ data models in a multi-client (multi-tenant) cloud environment, delivering end-to-end from design through testing and post-deployment validation.
- Specialize in data standardization, identity crosswalks, and person-matching / identity resolution, with a strong data-quality-control mindset and meticulous, well-documented work.

CORE TECHNICAL SKILLS

- **Data warehousing:** Snowflake (schemas, multi-client design, cross-database references).
- **Transformation:** dbt (models, macros, tests, documentation); advanced SQL.
- **Languages:** SQL (primary), Python (scripting, automation), YAML.
- **Pipelines & orchestration:** AWS Step Functions, S3; config-driven pipelines; scheduled dashboard/report deployment.
- **Data modeling:** Dimensional modeling, grain design, layered staging-to-analytics architecture.
- **Data quality control:** Automated tests, validation queries, post-deployment reconciliation.
- **Specialized logic:** Multi-source standardization, identity crosswalks, person-matching / identity resolution.
- **Domains:** Data Modeling, Data Warehousing, Cloud Architecture, Data Governance, Query Optimization, Data Quality.
- **Tools:** Git/GitLab, technical writing, architecture diagrams.
- **AI-assisted development:** Cursor, ChatGPT - with a disciplined validate-against-codebase workflow (every generated line reviewed, tested, and reconciled before merge).

PROFESSIONAL EXPERIENCE

Data Engineer - EAB

November 15, 2021 - June 30, 2026

- Designed and maintained enterprise-scale data pipelines on Snowflake and dbt, contributing across 1,400+ data models from ingestion through analytics-ready and export layers.
- Standardized high-volume, multi-source inputs into a shared common data format for consistent, reusable downstream reporting and analytics.
- Built identity crosswalks and person-matching logic to link and deduplicate records across multiple source systems.
- Implemented data-quality-control checks (grain/uniqueness, null, and row-count reconciliation) plus phased post-deployment validation to ensure trusted outputs.
- Developed monitoring for scheduled data feeds, standardizing run statuses and severity thresholds to surface failures early and keep delivery on schedule.
- Automated scheduled deployment of dashboards and client-facing reports.

Personnel Chief - United States Marine Corps

September 1998 - February 2016

- Personnel administration, records, and compliance; trained and supervised personnel for readiness and reporting.
- Automated the distribution and analysis of mandatory-training compliance data (20+ modules) for 1,200+ Marines across 20+ Department of Defense organizations, including Joint Staff, DTRA, DARPA, DIA, NDU, and WHMO; built MS Excel solutions with complex formulas that broke a single enterprise master report into 20+ targeted, section-level reports flagging complete vs. incomplete training with names and dates - an early analog to the data standardization and pipeline work I do today.
- Recognized an operational bottleneck and engineered a data-driven fix: replaced manual sign-in with an MS Excel check-in system keyed on DoD ID lookup, cutting per-person processing from 30-60 seconds to under 5 (up to 12x faster) and clearing long lines of senior officers - the same instinct for turning slow, manual processes into automated, data-backed workflows that drives my engineering work today.

EDUCATION

- **B.S., Computational and Data Science** - George Mason University, 2017-2021.
- **Northern Virginia Community College** - 2016-2017.
